

CMC 403

The CMC 403 casting was developed for suspension of refractory curtains, baffles and lintels in a wide variety of high-temperature applications.

Features of the CMC403 casting:

- suspends Merkle MT Modu-Lok refractory shapes from the main support beam to form furnace baffles, curtains and lintels of various widths and heights - customized to your application.
- is designed for easy, fast installation. It fits a wide variety of beam flange widths - from 4 to 11 inches. The two halves are connected with standard threaded rod and nuts.
- is made of heat resistant cast iron that can withstand service temperatures up to 1600°F.
- accommodates thermal expansion by allowing both movement of the casting along the support beam and movement of the refractory shape within the casting.
